

Firewall Rule Set Review

Your organisation needs to be able to implement network filtering and firewall controls to protect your key assets, but does the implementation of the firewall policy leave you with additional challenges for management and auditing? How do you gain assurance that your infrastructure is correctly protected once the firewall rule sets have been implemented?

Are all your firewall rule sets consistent with company policy?

Old rule sets or those added for testing could be exposing your systems to an excessive level of risk. Are your rule sets documented and reviewed in a manner that enables the associated risk to be accurately assessed? You need to be able to measure the changes in the level of risk your business is exposed to through its firewall rule sets.

Our firewalls had been in place for many years and I wanted to have confidence they were still enforcing a secure policy in line with my expectations. The review gave me the answers I needed.

Security Manager,

Finance Sector

Do you know if the rule sets applied to the devices in your organisation are enforcing the policy as you expect?

Do you have ongoing visibility and assurance that the change control processes are operating as expected?

Is the security of your organisation reliant on devices which are maintained or managed by third parties?

How do you measure the compliance of your firewall rule sets against standards such as PCI DSS?

Does the output from your rule set reviews enable your QSA to sign them off as compliant? Does your current provider understand and appreciate the background of your compliance requirements? Are you being exposed to a significant level of risk through your third parties?

Do you have the tools to effectively disseminate security sensitive information directly to the relevant parts of your organisation?

Often the hardest challenge comes from organising the technical findings. Can you easily assign accountability for remediation activities and set deadlines. The output from the service is available through MWR InfoSecurity's FastHold portal. This enables you to distribute the results efficiently and

securely to the teams within your organisation who need them.

MWR InfoSecurity can provide a solution to all of these issues through its Firewall Rule Set Review services.

They offer greater visibility of the risk associated with a firewall rule set whether this is internet facing or controlling your network from a partner or supplier. Results are provided securely through the FastHold Information Management Portal.

The benefits of the Firewall Rule set Review and its integration with the FastHold portal include:

Clear and Concise Results

are provided in all your reports and can be easily and securely accessed through MWR InfoSecurity's FastHold platform enabling you to work more efficiently.

Our Proven Technological Expertise

means you can have confidence in the knowledge and experience our consultants bring to protecting your technology from attack. Our consultants can offer practical advice on how to reduce the risk your business is exposed to.

Our Threat Aligned Approach

enables MWR InfoSecurity consultants to directly reflect the implications of current and emerging threats enabling you to accurately understand the risk your organisation is exposed to.

MWR's alignment with standards such as PCI DSS

enables you to demonstrate compliance whilst also providing clear guidance about how rule sets can be enhanced.

Using Firewall Rule Set Reviews as part of your security management programme gives you the ability to easily assess important controls within your organisation.

The service provides you with assurance in the implementation of rule sets applied to the devices that enforce your security policy. This approach enables you to have confidence in your implementation and to provide evidence to accreditors, assessors and auditors that you are managing your information assets in line with your policy statements.

My firewall administrators are very busy and needed some help gaining confidence in the rule sets that have grown to over 300 rules per device. The review conducted by MWR helped them to understand the implications of our configuration.
