
Managed Security Scanning (MSS)

As someone with responsibility for Information Security you may find that managing the associated risk can result in more challenges than solutions. If you have a requirement to perform security scanning against your most critical systems you *need* solutions that work for your business and to your timescales.

How do you currently identify vulnerabilities on your public facing network?

How do you as an organisation demonstrate compliance and due diligence? Do you have the ability to reassess your systems as and when this is needed? Network landscapes change over time and you need to have assurance that you are not exposing your business assets to unnecessary risk.

Do you struggle to find time to make sure that scanning goes ahead as planned and to schedule?

It can prove difficult to stick to a schedule when other priorities take over. Co-ordinating scanning, communicating to the right people that a scan is going ahead and then distributing the results can be a time consuming and often thankless task.

It is good to know that the scans will be done regularly and on time. Previously we scanned in-house, but scans were occasionally delayed or not done due to higher priorities for our staff.

*Head of IT,
Legal Sector*

Once the scan has taken place the effort of handling the technical findings can be the real challenge; how do you currently handle the results?

Do you have support and assurance via email and telephone during the vulnerability remediation process? Are you immediately alerted to risks that affect your organisation? An experienced scanning provider can offer assurance about the status of your organisation's security.

How do you distribute the findings of testing directly to the team responsible for implementing a resolution?

Our secure portal FastHold ensures a secure flow of sensitive information to authorised personnel only.

The benefits of the **Managed Scanning Service** and its integration with the **FastHold** platform include:

FastHold offers customisable reporting and management of user access;

allowing you to control the level of access for users within your organisation. HTML reports allow you to drill down into greater detail without being overwhelmed by pages of PDFs. While PDFs also offer the flexibility for you to download and print the results as required.

Clear and Concise Reporting,

allowing you to instantly identify areas of risk so you can focus on reducing the external threat. Vulnerabilities are classified as high, medium or low risk, enabling you to see at a glance the level of risk posed to your organisation. Full descriptions of the vulnerability and remediation advice are provided per risk and per host saving you time and effort.

Issue Manager enables you to control the remediation process within your team;

this gives you complete control over your issues allowing you to assign them to groups or individuals to review or remediate.

Increase or decrease the severity depending on its impact to your organisation;

This ensures the results are relevant and appropriate when presenting them back to your organisation. Alternatively, as an organisation you can choose to accept the risk.

We are an experienced scanning provider

and we have worked with a variety of organisations large and small, delivering professional results through a professional service.

Managed Security Scanning will give you a regular view of your security posture, identify areas for improvement and let you track your progress as you secure your infrastructure. The advantages go beyond the direct business benefits of preventing breach and information loss, you can record and track your organisations compliance and demonstrate what has been done to prevent business disruption.
