

Managed PCI Security Scanning

As someone with responsibility for Information Security you may find that managing risk associated with PCI Security Scanning can result in more challenges than solutions. If you have a requirement to perform PCI security scanning against your most critical systems you *need* solutions that work for your business and to your timescales.

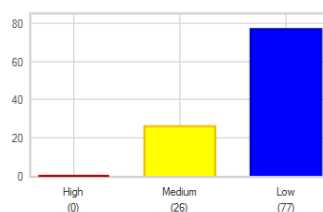

How does your organisation demonstrate compliance and due diligence?

Do you have an Approved Scanning Vendor (ASV) that offers support and assurance via email and telephone during the vulnerability remediation process? Are you immediately alerted to risks that affect your organisation? An experienced scanning provider that can offer assurance about the status of your organisation's security.

Do you have the ability to freely reassess your systems as and when it is needed?

Network landscapes change over time and you need to have assurance that you are not exposing your business assets to unnecessary risk.

Once the scan has taken place the effort of handling the technical

findings can be the real challenge, how do you currently handle the results?

Can you easily distribute findings to the relevant individuals or groups within your business? Are you able to maintain an audit trail of access to information about vulnerabilities within your organisation? Increasing visibility through the remediation process helps improve effectiveness and reduce timescales.

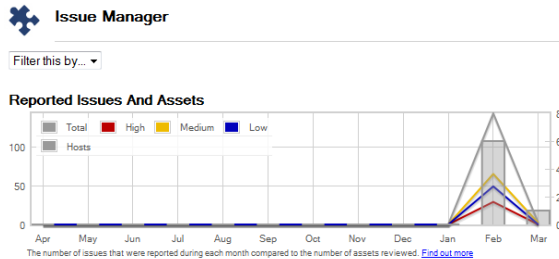

How do you distribute the findings of testing directly to the team responsible for implementing a resolution?

Our secure portal **FastHold** ensures a secure flow of sensitive information to authorised personnel only.

How do you track your security trends and monitor your patch management process?

By combining PCI ASV Scanning with Issue Manager you can visualise trends that affect your patch management. Group by business unit and you can

directly compare and contrast the remediation process across your entire organisation.

The benefits of the **PCI Scanning Service** and its integration with the **FastHold** platform include:

FastHold offers customisable reporting & management of user access allowing you to control the level of access for users within your organisation.

HTML reports allow you to drill down into as much detail as you require. PDF reports offer the flexibility for you to download and print the results as required.

Clear and Concise Reporting allows you to instantly identify areas of risk so you can focus on reducing the external threat.

Vulnerabilities are classified as high, medium or low risk, enabling you to see at a glance the level of risk posed to your organisation. Full descriptions of the vulnerability and remediation advice are provided per risk and per host saving you time and effort.

Issue Manager enables you to control the remediation process within your team;

this gives you complete control over your issues allowing you to assign them to groups or individuals to review or remediate.

Controllable User Access

ensures that colleagues or third parties can only see the information they need to do their job. Sensitive information relating to the overall security of the company remains confidential.

As a Qualified Security Assessor (QSA), MWR InfoSecurity have a detailed understanding of the underlying PCI DSS requirements and how PCI Scanning sits within them and can offer advice on issues relating to the standard.

We are an experienced scanning provider and we have worked with a variety of organisations large and small and deliver professional results through a professional service.

The PCI Scanning Service will give you a regular view of your security posture, identify areas for improvement and let you track your progress as you gain compliance. The advantages go beyond the direct business benefits of preventing breach and information loss; you can record and demonstrate what has been done to prevent business disruption.

MWR have a unique insight into the PCI DSS standard as they are both a QSA and an ASV – this has helped us on a number of occasions as we worked toward compliance.
