

Managed Internal Security Scanning

Managing the risks associated with Information Security can often result in more challenges than solutions. If you have a requirement to perform internal security scanning against your most critical systems you *need* solutions that work for your business and on your timescales. How do you identify vulnerabilities on your internal network?

How do you currently identify vulnerabilities on your internal network?

How do you determine outdated or rogue hosts, or identify breaches of company policy? Network landscapes change over time and you need to have assurance that you are not exposing your business assets to unnecessary risk. Do you have the ability to reassess your systems as and when this is needed?

Do you struggle to ensure that scanning goes ahead as planned?

It can prove difficult to stick to a schedule when other priorities take over. Co-ordinating scanning, communicating to the right people that a scan is going ahead and then distributing the results can be a time consuming and often thankless task.

Do you have access to technical resources to discuss technical findings?

Do you have support via email and telephone during the vulnerability remediation process? And do you have the reassurance that if a vulnerability is detected which is considered to present a significant threat to your organisation, you will be contacted immediately?

Can you distribute test findings directly to the team responsible for implementing a resolution?

Can you easily control the flow of sensitive information about the security of your systems across your organisation?

Internal Scanning with MWR gave me a better understanding of how insider threats affected my organisation and helped me to ascertain the potential impact of a successful attack.

IT Manager

Media Organisation

The benefits of the **Internal Scanning Service** and its integration with the **FastHold** platform include:

Clear and Concise Reporting,

allowing you to instantly identify areas of risk so you can focus on reducing the external threat. Vulnerabilities are classified as high, medium or low risk, enabling you to see at a glance the level of risk posed to your organisation. Full descriptions of the vulnerability and remediation advice are provided per risk and per host saving you time and effort.

FastHold offers customisable reporting and management of user access;

allowing you to control the level of access for users within your organisation. HTML reports allow you to drill down into greater detail without being overwhelmed by pages of PDFs. While PDFs also offer the flexibility for you to download and print the results as required.

Issue Manager enables you to control the remediation process within your team;

this gives you complete control over your issues allowing you to assign them to groups or individuals to review or remediate

Track your security trends and monitor your patch management process

By combining Internal Scanning with Issue Manager you can visualise trends that affect your patch management. Group by business unit and you can directly compare and contrast the remediation process across your entire organisation.

Increase or decrease the severity depending on its impact to your organisation;

This ensures the results are relevant and appropriate when presenting them back to your organisation. Alternatively, as an organisation you can choose to accept the risk.

We are an experienced scanning provider and we have worked with a variety of organisations large and small, delivering sophisticated results through a professional service.

Managed Security Scanning will give you a regular view of your security posture, identify areas for improvement and let you track your progress as you secure your infrastructure.

The advantages go beyond the direct business benefits of preventing breach and information loss, you can record and track your organisations compliance and demonstrate what has been done to prevent business disruption.
